

Patient & Recording Details

Patient ID:	Patient-2
EEG File:	eeg50.edf
Recording Date:	2026-04-13 05:09:48.054508+00:00
Duration:	164.2 minutes

Detection Summary

Prediction:	Seizure Detected
Confidence:	99.6% (High confidence)
Threshold:	0.16
Mean Probability:	21.1%
Windows Analysed:	985
Seizure Windows:	287
Estimated Seizure Duration:	47.9 minutes
Dominant Region:	Frontal-Temporal

Clinical Findings

The analysis detected seizure-like activity with high confidence (99.6%). Estimated abnormal activity duration was approximately 47.9 minutes. The strongest explainability signals were observed in the frontal-temporal region. Highest model relevance was observed in channels such as F8-T4, T4-T6, F4-C4. These should be interpreted as supportive explainability cues rather than clinical proof.

Seizure Probability Timeline

Top Channel Contribution

Top Channel Details

- F8-T4: 95.0% (Frontal-Temporal)
- T4-T6: 88.0% (Temporal)
- F4-C4: 81.0% (Frontal-Central)
- FP2-F4: 74.0% (Frontal)
- C4-P4: 67.0% (Central-Parietal)

Recommendations

- Immediate clinical review is recommended.
- High-confidence detection supports urgent correlation with EEG waveform review.
- Consider prolonged seizure burden assessment and continued close monitoring.
- Review activity in the frontal-temporal region for focal involvement.
- This output should be interpreted by a qualified healthcare professional.

Explainability Summary

Highest model relevance was observed in channels such as F8-T4, T4-T6, F4-C4. These should be interpreted as supportive explainability cues rather than clinical proof.
